## Introduction

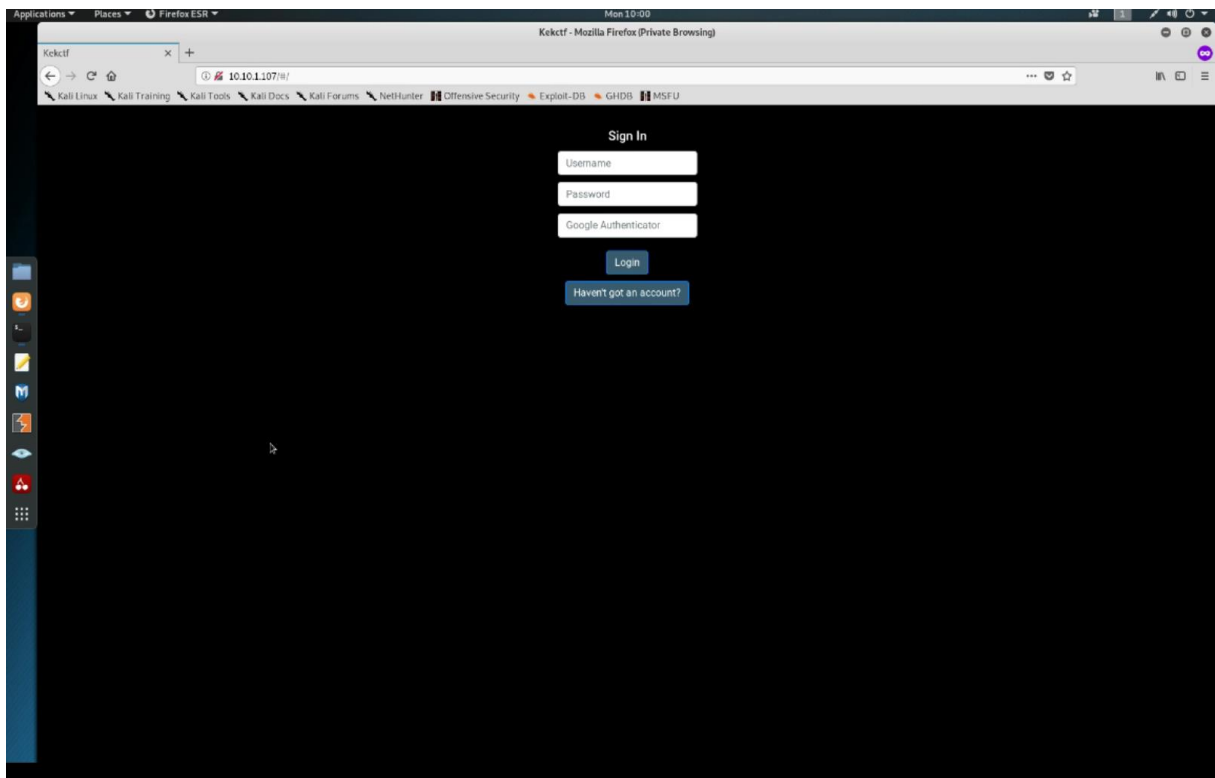

In the second round of the Red vs Blue event we got assigned other systems than last time. This way other testers could see if the applications were truly secure. Robin and Bob picked the CTF dashboard.

Owner	Application	Goals	Accounts	IP's	VLAN
Michel Bijnen	A CTF dashboard to see challenges, submit flags and see the scoreboard.	Authentication, JWT Tokens and the microservices are very important, as well as other vulnerabilities. Becoming admin as a normal user can be the main goal to find. Out of scope: not using SSL (with a domain this would be a lot easier but due to seclab out of scope) unauthorized access to the direct microservices (this should be handled by the firewall which is not configurable for us)	User accounts can be created in the signup page.  Admin account (please don't delete this account): Username: admin Password Testtest123! Auth. App secret code: 2M7C46NVBMH3UMR6RADV JLVMPP3JCLRQ2	Front-end: 10.10.1.107 Microservices: 10.10.1.108 Database: 10.10.1.108	1472_Client1-VLAN

## Testing

Started with a ping to check if the hosts were up.  
They were up.

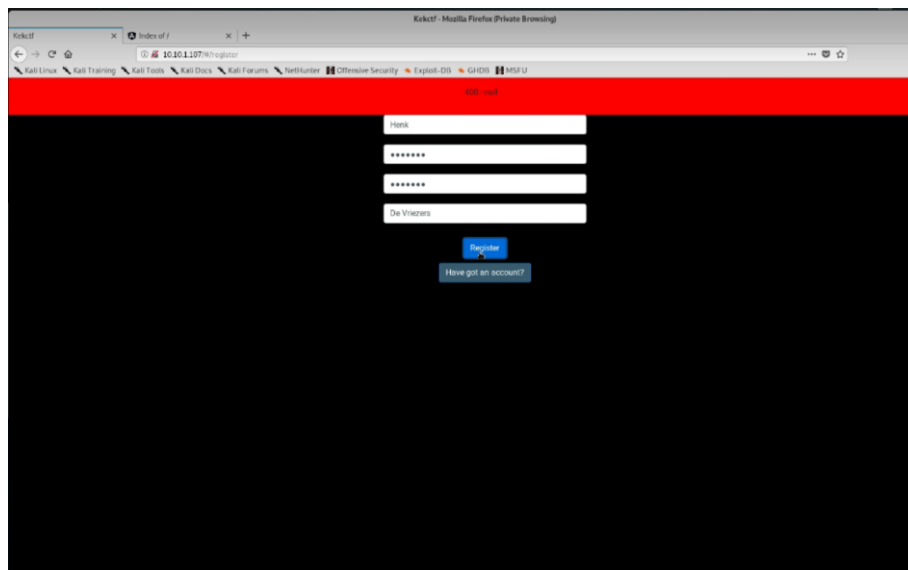

The frontend on 10.10.1.107

Nmap `nmap 10.10..1.108 -Pn -p- -sC -sV`, full output in appendix.

## Portainer

Docker containers, can't see version.

13.30 could log in

SQLI

Regular error message.

## Summary

We first had some problems with connecting to the Seclab. After some scanning and indexing we tried to find some weaknesses but could not find a big threat. The seclab being super slow did not help either. We also had some problems with the authenticator which was for the most part our fault. The best thing we found is the username leak. It would be nice if it were possible to scan these machines some time before the actual red vs blue.
